

### Abstract

An elevator destination floor display unit according to the present invention is installed in an elevator boarding area or an elevator car. The elevator destination floor display unit has a display portion having a screen capable of selectively displaying destination floor representations relating to all floors, and a display control portion which arranges and displays, in a matrix form, only destination floor representations of destination floors registered on the screen. Therefore, the unit decreases the area of the required display space, makes it possible to visually recognize destination floor representations with ease, and possesses a high degree of freedom for installation.
